Seated straight-bar pressdown

Elbow extension / triceps / 8-12

MAIN: Triceps brachii: straightens the elbow.

SECONDARY: Forearm muscles steady the grip and wrist; shoulder muscles hold the upper arms beside the torso.

BASE / SUPPORT: Trunk muscles hold a quiet seated posture; both feet and the chair provide support.

01 / Check the setup

Use one secure high rack anchor, one rated pull line and a straight-bar attachment. Position a stable chair so the line stays in front of the body.

02 / Set the base and brace

Plant both feet; sit tall. Keep upper arms beside the ribs and wrists in line with forearms. Choose a grip you can hold without strain.

03 / Move with control

Exhale and extend the elbows without pushing the shoulders down with body weight. Keep the upper arms nearly still.

04 / Limit the range and return

Stop short of snapping the elbows straight. Return gradually into comfortable elbow flexion without letting the bar rise toward the face.

WATCH FOR: Avoid a rocking torso, bent wrists or moving the whole upper arm. Reduce load if the elbows or grip lose control. EASIER: Rehearse the elbow motion unloaded or use a lighter single-handle variation matched to current tolerance.

Soft joints, normal breathing. Colours describe exercise roles, not measured activation. Hidden muscles are named in text. No fixed resistance is prescribed.

Stop for pain, new numbness or weakness, dizziness, loss of grip, moving supports or damaged bands. Keep the recoil path clear. Follow manufacturer limits and individual clinical restrictions.
