Supported sit-to-stand

Knee / hip extension / 6-10

MAIN: Quadriceps and gluteus maximus raise the body from the chair.

SECONDARY: Hamstrings and hip muscles coordinate the hip and knee movement.

BASE / SUPPORT: Trunk and ankle muscles help balance the body over the feet; the chair marks the return position.

01 / Check the setup

Place a stable chair against a wall. Choose a seat height you can rise from without dropping or straining. Start without bands.

02 / Set the base and brace

Sit near the front with feet about hip-width apart, heels planted and knees following the toes. Use armrests for assistance if needed.

03 / Move with control

Lean forward from the hips enough to bring weight over the feet, then stand smoothly. Breathe out during the effort.

04 / Limit the range and return

Finish upright with soft knees. Bend hips and knees to return under control; touch down rather than falling into the chair.

WATCH FOR: Avoid knees collapsing inward, breath-holding or pushing through pain. Use a higher seat or hand assistance. EASIER: Use a higher chair or more hand support; keep the same controlled return.

Soft joints, normal breathing. Colours describe exercise roles, not measured activation. Hidden muscles are named in text. No fixed resistance is prescribed.

Stop for pain, new numbness or weakness, dizziness, loss of grip, moving supports or damaged bands. Keep the recoil path clear. Follow manufacturer limits and individual clinical restrictions.
